P. C. STOCKHAUSEN
PHILADELPHIA

PREFACE.

Since the issue of the List of the Lepidoptera of boreal America, in 1891, much has been done to increase our knowledge of the order. Our conceptions of families and of their relation to each other have changed, and our system has become more scientific. No universal agreement has been reached; but such differences as exist will result in more careful studies until substantial uniformity has been attained. There have been monographic revisions of families and genera; some confined to our own species and published in America, some of wider scope, published abroad. The critical studies of American types in European Museums has been continued, and very few species need now be marked as "unknown" in any family. The changes made in these studies and the number of new species and genera described, demand a revised edition of the earlier list, which is herewith presented.

The old list enumerated 6020 species: the present list is numbered to 7169, an apparent increase of 1149 species; but this does not fairly represent the state of affairs, for in becoming acquainted with the older, heretofore unknown species, almost as many more recent names have dropped into the synonymy: and on the other hand, I have arbitrarily dropped some numbers at the end of the larger series to allow for additions, and in part that the numbers might in a way indicate at least the superfamilies. About 290 numbers should be allowed for this, and 75 may be added for synonyms and duplicated species in the old list. This makes a net increase of about 930 species, and indicates a creditable activity among the American students of the Lepidoptera.

In the present list, the same principles that guided the preparation of the previous one were kept in view. It is intended to be conservative, yet fairly representative of actual advances in classification. It is not for the catalogue-maker to decide upon the validity of species and genera except where he has special knowledge, and I have, in general, accepted the un-

challenged conclusions of the latest writer in those families that have been critically studied. So all species and genera are treated as presumably good, unless the contrary has been established.

It is intended that every specific name found in the list of 1891 shall also appear in this; but the synonyms of the old list are omitted, unless their right to specific or varietal rank has been re-established. Where a name now appears in the synonymy in the same genus in which it appeared as a species or variety in 1891, it is not especially distinguished; but where it now appears in another genus, it is followed by the number borne in the old list. All bracketed numbers refer to the old list whether they appear in the text or in the notes. Where a genus (like *Plusia*) has been broken up and the species of the old genus follow in successive genera, no especial reference has been deemed necessary.

Generic names referred as identical with others appear, so far as is practical, in the synonymy; but where, as in the Geometridæ, and in certain Tineid families, the entire arrangement has been changed, and new generic terms are the rule rather than the exception, the species bear the old list number as an appendix where they are not now under the same heading.

The generic synonymy in this list must not be too strictly taken, and it does not always mean that the name in italics represents the same concept as that printed in full faced type above it. It means only that the concept for which the used term stands, was represented in the old list rightly or wrongly, in whole or in part, by the term now placed in italics.

Dr. Henry Skinner is again to be credited with the list of Papilionoidea. Mr. W. D. Kearfott has prepared the list in the lower Tineoidea, basing it upon the work by Fernald, Busck and Dyar, as credited in Dyar's list (Bull. 52, U. S. Nat. Mus., 1902). In the Geometridæ, a revision of the family prepared by the late Dr. George D. Hulst has been used, and all the notes prepared just prior to his death have been regarded. The sequence of families, and the list except as above credited, must be charged to me; and I have drawn on

all sources, published or unpublished, in the effort to make it complete and accurate. Especial recognition must be given to Mr. Wm. Beutenmuller, who made many useful suggestions, and to whom I owe a revision of the list of Catocala. Dr. R. Ottolengui has assisted in the Plusiid series, and from many other of my correspondents I received notes that have proved useful. Individual credit is not possible in a work of this kind; but to all who have assisted in its completion my thanks are gratefully given.

Finally, it must be noted that, wherever I have had no more recent or specific guide, the sequence of species, and in the main the synonymy, is taken from the list of North American Lepidoptera, by Dr. Harrison G. Dyar, Bull. 52 of the U. S. National Museum.

New Brunswick, N. J.,
August 10, 1903.
